

least one of said first SRAM memory and the second SRAM memory being provided in the camera body;

recording means provided within the camera body for selectively recording image information on one of the first SRAM memory and the second SRAM memory;

changer means provided within the camera body for causing said recording means to change from recording of image information on one of the first SRAM memory and the second SRAM to recording of image information on the other one of the first SRAM memory and the second SRAM memory.

44. A camera according to claim 43, wherein said first SRAM memory is contained on an IC card which is detachably mountable to the camera body, and wherein said second memory is provided in the camera body.

45. A camera according to claim 43, further comprising:

reproduction means for reproducing image information recorded on a selected one of the first SRAM memory and the second SRAM memory; and

changing means provided within the camera body for causing said reproduction means to change from reproducing image information recorded on one of the first SRAM memory and the second SRAM to reproducing image information recorded on the other one of the first SRAM memory and the second SRAM memory.

46. A camera according to claim 45, wherein said reproduction means is provided within said camera body.
